#### **Silostop Oxygen Barrier System**

**Protects and seals your silage investment**

**The Silostop system has been developed for use on silage bunkers and piles. It offers the following benefits:**

**20 times more effective than a regular cover**

**Reduce dry matter loss in surface silage**

**No spoiled silage to remove**

**No poor performance due to feeding spoiled silage**

**Eliminate tyres**

**Reduce labour required**

**Protect from bird damage**

**The Silostop system consists of a unique oxygen barrier film, which prevents entry of oxygen into the surface of the silage bunker, combined with protective nets and gravelbags to provide the ideal covering system for silage.**

**Silostop film is the only silage film available which is designed specifically to eliminate oxygen from the silage; it is the only silage film which has an oxygen transmission rate of less than 100 units of oxygen per day. Research trials have demonstrated that using Silostop film results in a reduction in silage dry matter loss over traditional covering methods. At the same time, the difference can be seen visually in the quality of silage on the surface.**

**At the same time as improving the quality of silage on the surface, Silostop products can also eliminate the need for tyres or weights over the entire surface, leading to a reduction in labour required for covering and uncovering.**

**Silostop products have become part of the toolbox for production of top quality silage in many countries, and farmers throughout the world are experiencing the benefits that Silostop provides.**
